

Village Fountain

Our design was for a fountain that could sit in the middle of a town square or something of that nature. We looked at ancient Aztec pyramids for inspiration and wanted our fountain to have a sort of mystical/jungle look to it. There is a water pump in the center of the hollow pyramid that provides the water for the fountain. There is also a fog machine that is remote operated. The fog seeps out of the holes in the perforated brick at the base of the pyramid. CMU was used for the small wall surrounding the pyramid with one layer of brick over it. Small CMU columns are at the corners and they have plants draping down the columns. This helps add to the jungle look we were going for.
